

Evidence in Support of Inclusive Education

Learning Assistant Lesson | ED452C Session 7

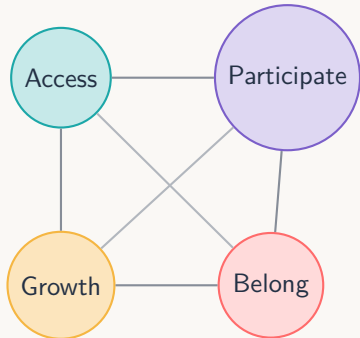

"Inclusion is not working just because students are in the room."

Today's purpose

- Reframe evidence beyond placement and task completion.
- Notice what gets missed when evidence is too narrow.
- Practice designing evidence collection that honors variability.

"The question is not only: Did the student finish? It is: What did the environment allow us to see?"

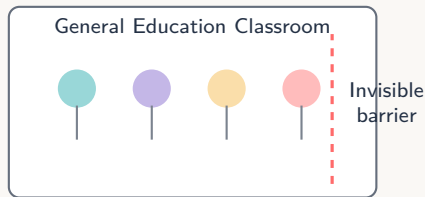

Big idea from the reading

Evidence for inclusion should show more than physical placement.

It should help us ask whether students are accessing instruction, participating meaningfully, showing growth, and remaining connected to the learning community.

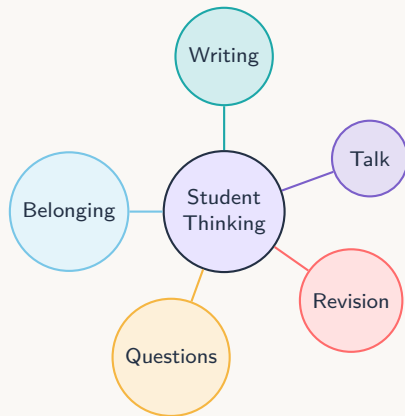

"A student can be present and still be excluded by what we choose to measure."

What can count as evidence?

- Written products and assessments
- Peer explanation and teacher conference notes
- Revision, persistence, and strategy shifts
- Questions students ask when they get stuck
- Belonging, participation, and confidence over time

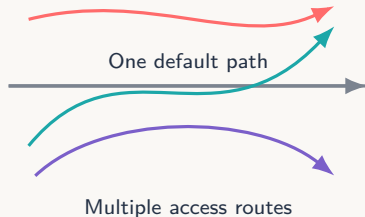

"The first visible product is not always the strongest evidence of learning."

Equity lens: who gets misread?

When evidence is narrow, we can confuse access barriers with ability. This is especially risky for students whose processing, language, communication, sensory needs, or cultural expectations do not match the classroom's default rhythm.

"If we only measure the easiest-to-see behavior, we may miss the hardest-working thinking."

Activity 1: Evidence sort

In pairs or triads: Sort the examples into three groups.

- Easy-to-measure evidence
- Process evidence
- Evidence we often miss

Then ask: **Which students are most likely to be misread if we only use the first group?**

"Evidence is a design choice before it is a data point."

Activity 2: Redesign the evidence plan

Choose one lesson you teach or remember. Add:

- two process checkpoints;
- one student voice prompt;
- one alternative way to show understanding.

Prompt: What would you see now that you might have missed before?

“A stronger evidence plan does not lower the goal. It gives the goal more ways to become visible.”

Leave with this

Before concluding that a student did not learn, ask:

- Did the student have access to the task?
- Did we collect evidence across the process?
- Did our evidence plan value belonging and participation?

"Look again before you conclude."

Based on ED452C Session 7: Evidence in Support of Inclusive Education.
